

Final submission package - Discussion 875

Candidate: Hiteshsai007

Project: CNCF KubeEdge Ianvs - Comprehensive Example Restoration, Phase IV

Live Discussion: <https://github.com/kubeedge/ianvs/discussions/875>

Live snapshot fetched: 2026-08-25

Live Discussion updated: 2026-08-25T08:05:12Z

Submission status

The live Discussion contains the complete Task 1-4 and Bonus package. Its current status is Written analysis and execution video attached. The execution video is linked in the live Task 2 comment:

Execution video: <https://youtu.be/VJqXbzt75cs>

The video is an evidence walkthrough, not a claim that a heavyweight production benchmark completed.

YouTube playback was not independently testable from the sandbox; the candidate should confirm the URL in an incognito/private browser window before sending the email.

Live task index

| Section | Live comment | Status |

|---|---|---|

| Task 1 - Root Problem Analysis | <https://github.com/kubeedge/ianvs/discussions/875discussioncomment-18121621> | Complete |

| Task 2 - Multi-PR Code Review | <https://github.com/kubeedge/ianvs/discussions/875discussioncomment-18121621> | Complete; execution video and PR 524 output attached |

| Task 3 - Repair Boundary Analysis | <https://github.com/kubeedge/ianvs/discussions/875discussioncomment-18121643> | Complete |

| Task 4 - Restoration Path Design | <https://github.com/kubeedge/ianvs/discussions/875discussioncomment-18121695> | Complete |

| Bonus - Supplementary Review Coverage |

<https://github.com/kubeedge/ianvs/discussions/875discussioncomment-18121701> | Complete; four additional reviews |

Rubric-aligned scope

- Root problem: implicit, timing-sensitive device-selection behavior across Ianvs Core and Example implementations.
- Task 1 issues: 765, 535, and 523; the analysis distinguishes Core ordering/default behavior from Example-local CUDA/MPS portability failures.
- Task 2 mandatory PRs: 767 (critical Core PR), 536, and 524. PR 764 is retained as supplementary conflict/control evidence.
- Task 2 execution evidence: PR 524 test command recorded 41 passed in 1.23s, with Python 3.11.2, PyTorch 2.13.0+cu130, and pytest 9.1.1. The production MOT17 benchmark, CUDA/MPS hardware, and full heavyweight examples are explicitly outside the executed boundary.
- Task 3: separates Core visibility ordering, shared semantics, Example-local migration, and CI guard responsibilities; it does not claim unexecuted gates passed.
- Task 4: gives staged migration, conflict handling, production-test gaps, verification gates, and rollback boundaries.
- Bonus: preserves the four-review section and its PR 802 reviewer-impact chain; it is not removed or replaced.

Verification boundary

Executed evidence is limited to the real Core constructor/control-flow probes on the pinned main and PR 767 revisions, plus the PR 524 test command. Full Government RAG and MOT17 benchmarks, external datasets/models/API credentials, and real CUDA/MPS hardware behavior were not executed and are not described as passed.

Source snapshot

The complete current live Discussion snapshot is saved locally as current-875-live.md - current-875-live.md. It is the source of truth for this package; stale drafts are not used.
